

How to Set Inherited VPN at Root in Remote Desktop Manager

YOU CAN MAKE A CHANGE TO YOUR CONFIGURED VPN ONCE, AND IT WILL BE APPLIED TO EVERY ENTRY

Have you noticed that some of the most important and impressive things in life are fairly straightforward? As Isaac Newton said: "Nature is pleased with simplicity."

Well, today we will take a look at one of the simplest — and also one of the most helpful — <u>features in <u>Remote Desktop Manager</u>: setting inherited VPN at root.</u>

This feature enables you to set VPNs as inherited in a folder or under a root. As a result, **you can make a change to your configured VPN once, and it will be applied to every entry that inherits their VPN configurations**. Plus, the time and effort-saving feature also works with Devolutions Gateway.

Setup Steps

Setting up this feature is (as you've no doubt guessed by now) very simple. There are just 4 steps:

- 1. Right-click the entry
- 2. Go to **Properties** —> **Type**
- 3. Go to the **VPN/SSH/Gateway** tab
- 4. Select Inherited

Connection Connection VP3VSS4/Gsteway VS1VSS4/Gsteway VS1VSS4/Gsteway Connection Con	Credentals (VPN/S	styl/Gateway)			

Once you set your entries to **Inherited**, all your configurations will now use your folder or root configurations. This means **you no longer have to modify each entry when you change your VPN settings**.
