About Azure Service Principal

An Azure Service Principal is a security identity used by user-created apps, services, and automation tools to access specific Azure resources. Think of it as a "user identity" (login and password or certificate) with a specific role, and tightly controlled permissions to access your resources. Unlike a general user identity, it only needs to be able to do specific things. It improves security if you only grant it the minimum permissions level needed to perform its management tasks.
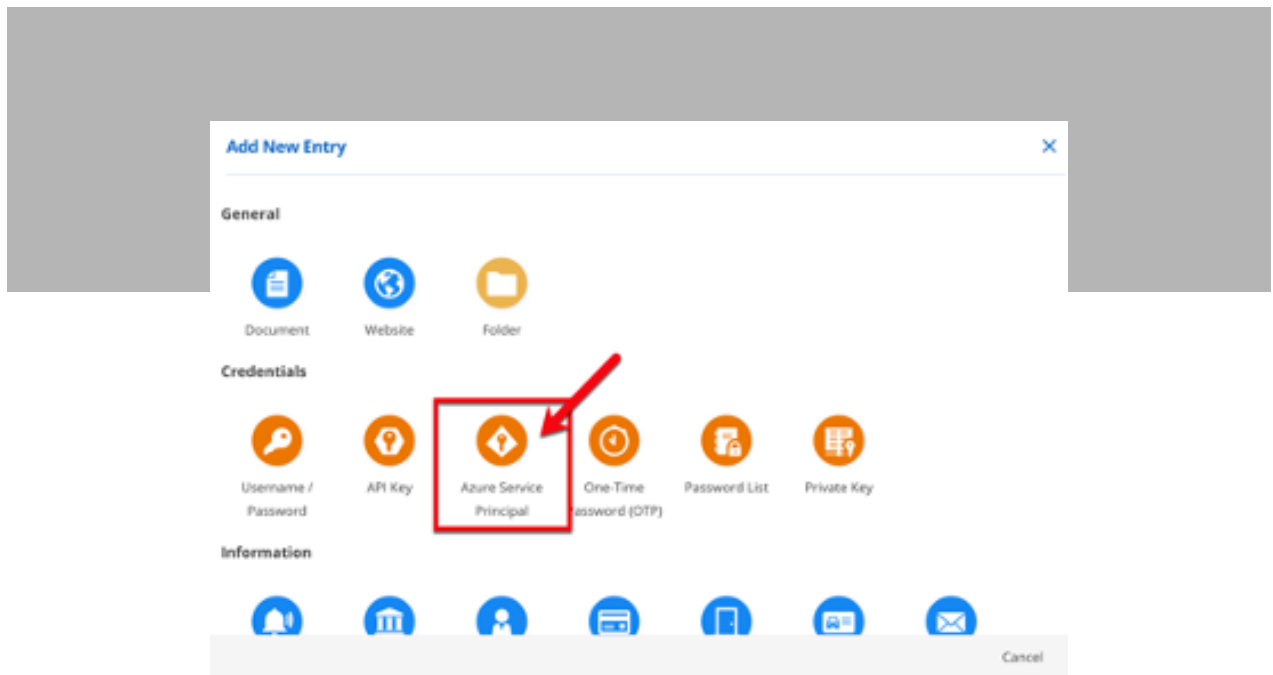

Configuration

Here are the simple steps to create your new Azure Service Principal credential:

1. Log into Devolutions Password Hub, and click the **plus sign (+)** to add a new credential.

2. In the **Credentials** section, select **Azure Service Principal**.

3. Fill in the required information, and then click **Add**.

And that's it! You're all set to access your Azure Service Principal account directly from Devolutions Password Hub.
